

Situational Safety Awareness

Behavioural approaches to safety have delivered large improvements in group safety but safety performance has plateaued. Safety errors and violations resulting in accidents and incidents still occur.

Designed to complement existing safety programs, the SAFE4 program targets the area of Situational Safety Awareness – an area that has otherwise largely been left unattended by other safety approaches.

The SAFE4 program takes a personal approach – an approach that influences employees to choose to be safe. As a result the approach also becomes effective in the many situations where employees work unsupervised.

The benefits of the SAFE4 program include:

- Individuals improving their situational safety awareness by identifying environmental conditions and emotional states that increase the likelihood of a preventable incident

- Participants leave the workshop with their own 'SAFE4' - the four activities to which they commit to keep themselves switched on and situationally aware
- A focus on the individual - it is about and for them – there is no group work. It quickly answers the question, 'What is in it for me?'

What are the benefits to my organisation?

- Provides employees with another barrier to prevent an incident or accident
- Complements existing safety approaches
- Novel approach provides leverage to your organisation's safety strategy
- Participants buy in to their personal model of safety and their commitments to keeping themselves safe
